ZHAKHAROV, A. V., et al., Vychislitel'nyye Metody i Programirovaniye, XVI, 1971, pp 225-243

It is assumed that far interactions are essentially greater than near interactions and the latter can be neglected inside ΔV (the charged particle density is small) and that during a time interval $0 \leq t \leq T_0$ (T_0 is the time during which the behavior of the system is studied) the real particles inside ΔV behave as a unit; this is admissible for a finite T_0 and sufficiently small ΔV . The calculations are made in time cycles in which each cycle is divided into three steps: 1) calculation of the electromagnetic field at a fixed point in time $t = T$; 2) calculation of the motion of the large particles during the time interval $T < t < T + \Delta T$; and 3) determination of the charge particle density $\rho(r)$ in the layer $t = T + \Delta T$ by the known values of the coordinates of the particles.

"Investigating Threshold Characteristics of an FM Demodulator With Subtracted Deviations"

Tr. NII radio (Transactions of the Scientific Research Institute of Radio) 1970, No. 1, pp 12-20. (from RZh-Radiotekhnika, No. 3, March 71, Abstract No. 3A128)

Translation: An analysis is made of threshold characteristics of FM demodulators with a device for deviation subtraction which transforms the input signal with frequency modulation into an intermediate frequency signal with phase modulation. Two limiting cases of the obtained FM signal detection are examined. It is shown that, to improve the threshold characteristics of the demodulator, it is best to have a broad-band filter before limiting.

"Radiation Safety of the Population Living in the Vicinity of an Atomic Power Plant"

Moscow, Gigiyena i Sanitariya, No 4, 1970, pp 54-56

Abstract: Due to careful treatment of waste gases and liquids, installation of special facilities for long-term storage of highly active liquid and solid wastes, and creation of an extensive health zone, the Beloyarsk (uranium-graphite thermal reactor) and Novovoronszh (water-cooled thermal reactor) plants have not increased radioactivity in the atmosphere and waters of the area during the three years that they have been in operation. The amount of Sr⁹⁰ and Cs¹³⁷ in locally produced foods (potatoes, cabbage, milk, etc.) does not exceed the average levels for the country as a whole.

"Heat-Resistant Steel TsZh13 for Cast Parts of Gas Turbines"

Teploenergetika, No 5, 1970, pp 23-25

Abstract: On the basis of the investigation of a series of experimental variants of alloys for cast parts of gas turbines, the composition of steel 3Kh16N22V6B (TsZh13) was selected as the optimal one from the point of view of surface properties and weldability: 0.25-0.30% C, 15-17% Cr, 21-23% Ni, 5.5-6.5% W, 0.8-1.2% Nb. Details on the production and application of the steel are presented. The steel is recommended for the production of profile castings of the guiding units of gas turbines and other similar subassemblies with a working temperature of up to 750° C.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. DURING AUGUST SEPTEMBER 1967 A STUDY WAS MADE OF SMALL SCALE INHOMOGENEITIES AND THEIR MOVEMENTS IN THE LOWER IONOSPHERE BY THE SPACE SEPARATED SIGNAL RECEPTION METHOD USING A MEDIUM WAVE BROADCASTING STATION (IF GAMMA 400 KC-SEC). THE RECEIVING STATION WAS 300 KM FROM THE TRANSMITTER. FRAME ANTENNAS WERE PLACED AT THE CORNERS OF A RIGHT ANGLE EQUILATERAL TRIANGLE WITH A BASE ABOUT 600 M IN LENGTH. MEASUREMENTS WERE MADE ONLY AT NIGHTTIME. THE SIGNAL WAS REGISTERED WITH A FOUR CHANNEL AUTOMATIC RECORDER. IT WAS FOUND THAT THE DIMENSIONS OF INHOMOGENETIES FALL IN THE FOLLOWING RANGES: FOR THE SEMIMAJOR AXIS FROM 600 TO 2,000 M WITH A MEAN VALUE 1,600 M AND FOR THE SEMIMIDR AXIS FROM 300 TO 900 M WITH A MEAN VALUE 550M; E VALUES (ELONGATION) WERE IN THE RANGE 2:1 TO 4:1 WITH A MEAN VALUE 3.25:1. IN MOST CASES THE INHOMOGENEITIES WERE ELONGATED ALONG THE MAGNETIC MERIDIAN. DRIFT VELOCITY VARIED IN A WIDE RANGE FROM 8 TO 120-M SEC, BUT THE MOST PROBABLE VELOCITIES WERE IN THE RANGE 10-30 M-SEC. THE PREDOMINANT DRIFT DIRECTION WAS NW AND SE. DURING THE EVENING AND EARLY IN THE NIGHT A NW DIRECTION PREDOMINATES, BUT SE PREDOMINATES IN THE MORNING. CHANGE OF DIRECTION OCCURS AT ABOUT 0200-0400 HOURS. THIS MAY BE ATTRIBUTABLE TO THE PRESENCE OF A DISCONTINUITY BETWEEN OPPOSITELY DIRECTED AIR FLOWS NEAR THE REFLECTION LEVEL. DURING THE EVENING THE REFLECTION LEVEL IS IN THE REGION OF WESTWARD MOVEMENT AND ONLY TOWARD MORNING IS THE REFLECTION LEVEL OR THE REGION OF AIR CURREYTS ITSELF AT AN ALTITUDE WHERE EASTWARD MOVEMENT IS OBSERVED.

"Determining the Probability of Message Distortion for a Known Law of Distribution of Error Bursts in Communications Channels"

Moscow, Pribery i Sistemy Upravleniya, No 1, Jan 73, pp 9-12

Abstract: A general formula convenient for engineering calculations is derived for calculating the probability of distortion of a message comprised of n symbols in terms of the mathematical expectations of the length of an error burst and the length of an interval between bursts. The resultant formula is true for any communications channel for which the flow of error bursts may be considered an arbitrary flow of events with limited aftereffect. The formula shows satisfactory agreement with the actual distribution of interference in communications channels.

"Effect of Bromine Ions on Electrochemical Behavior of Nickel in NiSO_4 Solutions at 25-200°"

Moscow, Zashchita Metallov, Vol 8, No 3, May-Jun 72, pp 270-272

Abstract: The article describes results of a study of the electrochemical behavior of nickel in NiSO_4 solutions in the presence of Br^- ions at 25-200°. At low temperatures the bromine ions somewhat accelerate the deposition of nickel, but slow down its dissolution, while at high temperatures the bromine ions have practically no effect on the electrochemical behavior of nickel.

"Some Mechanical Properties of a Fibrous Composite Material Based on an Aluminum Alloy"

Moscow, Fizika i Khimiya Obrabotki Materialov, No 5, Sep-Oct, 73, pp 117-122

Abstract: The authors produce a series of fibrous composites made from aluminum alloy and wire made from the EP322 grade steel. This was done by the hot rolling method using the scheme for bonding packs. Reinforcing the aluminum alloy with 12.4 volumetric percent wire increases the specific strength of the material from 15.2 to 19.7 km. The best properties are ensured by a bonding scheme which incorporates the simple multi-layer (two-layer) winding of the fibers onto the sheets of the matrix.

"Investigation of the Thermoemission Properties of the Faces of a Tungsten Monocrystal by the Methods of Electron and Ion Emission"

Izvestiya Vysshikh Uchebnykh Zavedeniy Fizika, No 6, 1970, pp 7-11

Abstract: The emission properties of a densely packed (110) face and a friable (111) face of a tungsten monocrystal were studied by means of specimens in the form of strips in flat-shaped instruments, with a residual gas pressure of 1×10^{-9} mm Hg. The design of the instrument permitted the simultaneous measurement of the emission currents of two specimens. The orientations of the specimens were determined by means of chemical etching and x-rays. The most probable values of $\phi_{(hkl)}$ for homogeneous faces (110) and (111) were found by the method of thermoelectronic emission and by positive surface ionization of lithium atoms. For faces (110) this value was 5.30 ± 0.03 electron volts; and for faces (111), 4.20 ± 0.02 electron volts. The maximum for faces (111) observed on a graph of $\lg I^+ = f(5040/T)$ in the range of temperatures below 1500°K is explained

"The Laser Electroretinogram"

Moscow, Vestnik Oftal'mologii, No 2, 1973, pp 3-6

Abstract: By applying stimulation of the eye in tolerated doses with radiation at approximately 630nm emitted by a He-Ne laser of type IG-50, pure cone electroretinograms of rabbits and humans were obtained. The output power of the laser was 0.2 mwt and the power at the retina ≤ 0.15 mwt. Short stimuli with a duration of 0.02 or 0.4 sec and intervals of 1 min between them were applied. Under conditions of adaptation to a weak source of daylight (illumination at the eye approximately 3 lux), the electroretinograms were due solely to the bioelectric activity of the cones. Under conditions of dark adaptation, the rod apparatus of the retina began to participate in the reaction. Laser electroretinograms of humans were obtained for the first time in the work described. Experiments with ruby and Ar lasers are being conducted at present in an expanded stage of the investigation.

"A Method for Decreasing False Information Fed Into a Computer From a Television Transmitting Tube"

Leningrad, Elementy Tsifrovyykh Sistem Upravleniya, "Nauka," 1971, pp 44-50

Abstract: Highly sensitive television tubes are in wide usage today for analyzing the light fields carrying information concerning the state of a unit. However, a fluctuating noise also exists at the output of the television transmitting tube in addition to the signals carrying the desired information at low levels of illumination of the unit's light field. This fluctuating noise results in errors in the operation of the registering circuit (the threshold device which reacts to the instantaneous value of the signal). These false signals complicate the processing of the real information and increase the number of computations required. With a low signal-to-noise ratio in the channel for converting the light signal into an electrical signal it is simply impossible to analyze the information with the aid of a digital computer. The authors conclude that the automatic identification of a unit with a television transmitting tube and a computer

"Ship Gyroscope Errors in Waves"

Moscow, Izvestiya Akademii Nauk SSSR, Mekhanika Tverdogo Tela, No 2,
Mar-Apr 71, pp 142-146

Abstract: Probabilities were defined for characteristics of the orbital motion of the center of gravity of a ship and the necessary transfer functions for computing dynamic errors in gyroscopic devices. Typical wave conditions were used to obtain numerical values for the acceleration spectrum parameters. The wave-to-ship relation was treated as a dynamic statistical random signal moving across a dynamic system. Relations were established for wave spectral density of acceleration, ship transfer function, ordinate dispersion of wave profile, horizontal motion of ship, vertical deviation angle of pendulum, and movement of pendulum support from ship's center of gravity. Computations were made for error caused by horizontal displacement of the ship's center of gravity. The conclusions were that dynamic errors caused by orbital motion and by pitch and roll motions are in the same order of magnitude. Therefore it is necessary to consider the effect not only of ship's pitch and roll motion but also of the orbital motion of ship's center of gravity. This is necessary when calculating errors of gyroscopic devices affected by wave motions.

"Investigation of the Thermoemission Properties of the Faces of a Tungsten Monocrystal by the Methods of Electron and Ion Emission"

Izvestiya Vysshykh Uchebnykh Zavedeniy Fizika, No 6, 1970, pp 7-11

Abstract: The emission properties of a densely packed (110) face and a friable (111) face of a tungsten monocrystal were studied by means of specimens in the form of strips in flat-shaped instruments, with a residual gas pressure of 1×10^{-9} mm Hg. The design of the instrument permitted the simultaneous measurement of the emission currents of two specimens. The orientations of the specimens were determined by means of chemical etching and x-rays. The most probable values of $\phi_{(hkl)}$ for homogeneous faces (110) and (111) were found by the method of thermoelectronic emission and by positive surface ionization of lithium atoms. For faces (110) this value was 5.30 ± 0.03 electron volts; and for faces (111), 4.20 ± 0.02 electron volts. The maximum for faces (111) observed on a graph of $\lg I^+ = f(5040/T)$ in the range of temperatures below 1500°K is explained

"The Laser Electroretinogram"

Moscow, Vestnik Oftal'mologii, No 2, 1973, pp 3-6

Abstract: By applying stimulation of the eye in tolerated doses with radiation at approximately 630nm emitted by a He-Ne laser of type LG-50, pure cone electroretinograms of rabbits and humans were obtained. The output power of the laser was 0.2 mwt and the power at the retina \leq 0.15 mwt. Short stimuli with a duration of 0.02 or 0.4 sec and intervals of 1 min between them were applied. Under conditions of adaptation to a weak source of daylight (illumination at the eye approximately 3 lux), the electroretinograms were due solely to the bioelectric activity of the cones. Under conditions of dark adaptation, the rod apparatus of the retina began to participate in the reaction. Laser electroretinograms of humans were obtained for the first time in the work described. Experiments with ruby and Ar lasers are being conducted at present in an expanded stage of the investigation.

"A Method for Decreasing False Information Fed Into a Computer From a Television Transmitting Tube"

Leningrad, Elementy Tsifrovyykh Sistem Upravleniya, "Nauka," 1971, pp 44-50

Abstract: Highly sensitive television tubes are in wide usage today for analyzing the light fields carrying information concerning the state of a unit. However, a fluctuating noise also exists at the output of the television transmitting tube in addition to the signals carrying the desired information at low levels of illumination of the unit's light field. This fluctuating noise results in errors in the operation of the registering circuit (the threshold device which reacts to the instantaneous value of the signal). These false signals complicate the processing of the real information and increase the number of computations required. With a low signal-to-noise ratio in the channel for converting the light signal into an electrical signal it is simply impossible to analyze the information with the aid of a digital computer. The authors conclude that the automatic identification of a unit with a television transmitting tube and a computer

"Optical and Electron-Microscope Studies of Rat Myocardium Exposed to Pure Oxygen at Low Barometric Pressure"

Frunze, Soverskoye Zdravookhraneniye Kirgizii, No 6, 1970, pp 8-11

Abstract: Wistar rats were kept in a pressure chamber at 170 mm Hg (corresponding to an altitude of 10,500-11,000 m), where they were exposed for 6 hours to a mixture of gases containing 94-96 percent pure oxygen, 0.3-1 percent carbon dioxide, and 1-2 percent nitrogen. Myocardial slices obtained at various intervals after the experiment (duration 7 days) were stained with hematoxylin-eosin and by Selye's method to detect fuchsinophilic degeneration. Small degenerative areas were noted in the myocardium within 24 hours of exposure to both hyperoxia and decompression. The areas were localized mainly in the middle and outer muscular layers. Electron-microscope study of the cells revealed structural changes in the mitochondria, fraying of the myofibrils, and enlargement of the endoplasmic reticulum, apparently the result of impaired ion exchange and related tissue hydration. The changes in the organelles of myocardial cells were paralleled by numerous hemorrhages and ruptures of capillaries. By day 7 there were signs of restoration of the normal submicroscopic structure of the myocardium and capillary walls.

"A Study of the Alkaloids of Malacocarpus Crithmifolius"

Tashkent, Khimiya Prirodnikh Soyedineniy, No 4, 1971, pp 538-539

Abstract: Malacocarpus crithmifolius (Retz.) of the family Zygophyllaceae, has so far not been studied chemically.

The authors collected specimens in the budding stage from the Ustyurt Plateau, Karakalpakskaya ASSR, in May 1970. This raw material was first moistened with soda solution or ammonia, then extracted with chloroform. A total of 0.064% alkaloids was found in the leaves, and 0.88% in the stems (percent of dry weight). The composition of the alkaloid $C_{10}H_{14}N_2$, and its mass and magnetic-resonance spectra, suggested that the base extracted from Malacocarpus crithmifolius was the same substance as this alkaloid. The infrared spectra of the two confirmed this view.

It is concluded that the extracted base is simply the dextrorotatory form of anabasine, extracted for the first time from vegetable material.

"Use of a Fungus Hydrolysate from Nutrient Yeasts as the Base of a Nutrient Medium for Phage Typing of *Salmonella typhi*"

Moscow, Laboratornoye Delo, No 9, 1971, pp 553-555

Abstract: A nutrient medium derived from yeast hydrolysate is a quick and inexpensive way of phage typing the agent of typhoid fever. The medium consists of the hydrolysate diluted with water (1:5), sodium chloride, and agar. Two drops of Vi-1 phage are added to a test tube with the hydrolysate after it is inoculated with *S. typhi* at the rate of 50 million cells in 1 ml of medium. Complete lysis occurs within 5 hours. The suitability of the yeast hydrolysate for typing *S. typhi* was successfully tested on 100 cultures isolated from bacteria carriers and typhoid patients.

"Resonance Acoustoelectric Effect in Selenium Rectifiers"

Uch. zap. Azerb. un-t. Ser. fiz.-mat. n. (Scientific Notes of Azerbaydzhani University: Physicomathematical Sciences Series), 1971, No 1, pp 82-85
(summary in Azerbaydzhani) (from RZh-Fizika, No 10, Oct 71, Abstract No 10YE777 by E. M. EPSHTEYN)

Translation: A study is made of the effect of the appearance of an electromotive force in a selenium rectifier exposed to sonic waves from an external source. Resonance is observed on the fundamental frequency of mechanical vibrations of the rectifier plane. The electromotive force is proportional to the square root of the reverse bias applied to the rectifier in the 2-10 v range. The effect weakens with large biases. The effect can be intensified by shunting the rectifier with inductance L and capacitance C. The corresponding values of L and C are calculated.

CLINICAL AND OCCUPATIONAL PROGNOSIS OF SCHIZOPHRENIA (ACCORDING TO THE FINDINGS OF AN EPIDEMIOLOGICAL SURVEY)

11- (Psychiatr)

(Article by N. M. Zharikov, Z. N. Serbryakova, Yu. I. Liverman, Institute of Psychiatry, USSR Academy of Medical Sciences, Moscow; Moscow, Vestnik Akade-
mi Meditsinskikh Nauk SSSR, Russian, No 5, May 1971, pp 31-34)

There is an enormous quantity of works in the psychiatric literature which deal with clinical and occupational prognosis on schizophrenics. However, as a rule these studies were pursued on the basis of samplings, and those that could be representative do not contain sufficiently differentiated clinical information about the patients and are performed in the scarical aspect. The use of the epidemiological method in psychiatry discloses new prospects in development of problems dealing with clinical and occupational prognosis. However, the existing discrepancies in diagnostic positions among psychiatrists and differences in clinical interpretation of the course of schizophrenia present great difficulties in evaluating the actual significance of epidemiological data. For this reason, specialists of different nations are currently engaged in a persistent attempt to develop methods of evaluating and classifying mental patients without the diamnestic acts of the researchers, and to render the results thus obtained accessible for quantitative evaluation.

In view of the distinctive features of mental diseases, for the purposes of epidemiological studies, of special importance is the development of special scales reflecting psychopathological structure and severity of the different symptoms. In view of the present status of clinical psychiatry, most adequate for a unified evaluation of mental patients should be a scale based on the syndrome levels.

On the basis of many years of clinical investigation of schizophrenia at the Institute of Psychiatry USSR AMN, different syndromes of schizophrenia were isolated and described. Using them it is possible not only to identify any condition of the patients at the time of examination, but also to describe the stage of development of the disease. The practice of using a roster of syndromes to evaluate patients and make diagnoses by representatives of different psychiatric schools has shown that there is sufficient agreement with respect to syndromological (as opposed to diagnostic) evaluation.

EXPERIMENTAL MINERALOGY

[Article by Doctor of Geological and Mineralogical Sciences V. A. Zharikov, Moscow, Vestnik Akademii Nauk SSSR, Russian, Vol 41, No 10, October 1971, pp 38-43]

One of the most important problems of geological science is learning the physicochemical regularities of the formation of minerals, rocks and ore deposits. The urgency of that task is determined not only by the state and direction of the development of the earth sciences but also by direct practical needs: understanding the physicochemical essence of natural processes is very important for the development of criteria in searches for ore deposits, especially those not cropping out. The obvious difficulty in solving the problems arising in that is intensified by the fact that the physicochemical transformations which lead to the formation of minerals, rocks and ore deposits under endogenic (deep) conditions are exceptionally complex. They take hundreds of thousands and millions of years and take place at high temperatures (at 1000 degrees or higher) and pressures (up to tens of thousands of atmospheres) under the conditions of the addition and withdrawal of hundreds of thousands to tens of millions of tons of matter. Such phenomena have no analogs in any sort of production or technological processes, on the experience of which classical physical chemistry and thermodynamics have grown to a considerable degree. Therefore the initial attempts of geologists to use the achievements of those branches of science, which appeared to be natural, were unproductive and even caused at one time an ideological crisis of the physicochemical direction in geology.

To solve the problem it proved necessary to determine the physicochemical characteristics of natural processes in the earth's crust and on that basis, using the apparatus of physical chemistry and thermodynamics, to develop general methods of investigation. Decisive successes in that area were achieved in the 1940s and 1950s by the Soviet scientist D. S. Korzhinskiy.

"Study of Low-Intensity Luminescence of Some Microorganisms"

Moscow, Biologicheskiye Nauki, No 7, 1971, pp 102-105

Abstract: Luminescence was studied in a wide variety of bacteria: those capable of growing through fermentation or respiration, obligate and facultative aerobes and anaerobes, containing and not containing cytochromes, e.g., *Clostridium butyricum*, *Pseudomonas aeruginosa*, *Ps. fluorescens*, *Bacillus subtilis*, and others. Spontaneous luminescence was observed only in *B. brevis* var. G. B. R, S, P⁺, and P⁻ forms, *B. subtilis*, *B. cereus*, *B. mycoides*, *B. mesentericus*, *B. megatherium*, and *E. coli*, i.e., aerobes that contain cytochromes and are ammonifiers. The intensity of luminescence is 110 imp/sec. The luminescence lies in the region of 420 to 520 nit with a peak at 480 nit. The culture fluid (centrifugate) is responsible for the phenomenon rather than the cells.

"Use of a Fungus Hydrolysate from Nutrient Yeasts as the Base of a Nutrient
Medium for Phage Typing of Salmonella typhi"

Moscow, Laboratornoye Delo, No 9, 1971, pp 553-555

Abstract: A nutrient medium derived from yeast hydrolysate is a quick and
inexpensive way of phage typing the agent of typhoid fever. The medium con-
sists of the hydrolysate diluted with water (1:5), sodium chloride, and agar.
Two drops of Vi-I phage are added to a test tube with the hydrolysate after
it is inoculated with S. typhi at the rate of 50 million cells in 1 ml of
medium. Complete lysis occurs within 5 hours. The suitability of the yeast
hydrolysate for typing S. typhi was successfully tested on 100 cultures iso-
lated from bacteria carriers and typhoid patients.

"Resonance Acoustoelectric Effect in Selenium Rectifiers"

Uch. zap. Azerb. un-t. Ser. fiz.-mat. n. (Scientific Notes of Azerbaydzhan University: Physicomathematical Sciences Series), 1971, No 1, pp 82-85 (summary in Azerbaydzhani) (from FZh-Fizika, No 10, Oct 71, Abstract No 10YE777 by E. M. EPSHTAYN)

Translation: A study is made of the effect of the appearance of an electromotive force in a selenium rectifier exposed to sonic waves from an external source. Resonance is observed on the fundamental frequency of mechanical vibrations of the rectifier plane. The electromotive force is proportional to the square root of the reverse bias applied to the rectifier in the 2-10 v range. The effect weakens with large biases. The effect can be intensified by shunting the rectifier with inductance L and capacitance C. The corresponding values of L and C are calculated.

CLINICAL AND OCCUPATIONAL PROGNOSIS OF SCHIZOPHRENIA (ACCORDING TO THE FINDINGS OF AN EPIDEMIOLOGICAL SURVEY) *211 (Psychiatry)*

(Article by N. M. Zharikov, Z. N. Serebryakova, Yu. I. Liberman, Institute of Psychiatry, USSR Academy of Medical Sciences, Moscow; Moscow, Vestnik Akademi Meditsinskikh Nauk SSSR, Russian, No 5, May 1971, pp 31-34)

There is an enormous quantity of works in the psychiatric literature which deal with clinical and occupational prognosis on schizophrenics. However, as a rule these studies were pursued on the basis of samplings, and these that could be representative do not contain sufficiently differentiated clinical information about the patients and are performed in the statistical aspect. The use of the epidemiological method in psychiatry discloses new prospects in development of problems dealing with clinical and occupational prognosis. However, the existing discrepancies in diagnostic positions among psychiatrists and differences in clinical interpretation of the content of schizophrenia present great difficulties in evaluating the actual significance of epidemiological data. For this reason, specialists of different nations are currently engaged in a persistent attempt to develop methods of evaluating and classifying mental patients without the diagnostic aids of the researcher, and to render the results thus obtained accessible for quantitative evaluation.

In view of the distinctive features of mental diseases, for the purpose of epidemiological studies, of special importance is the development of special scales reflecting psychopathological structure and severity of the different symptoms. In view of the present status of clinical psychiatry, most adequate for a unified evaluation of mental patients should be a scale based on the syndrome levels.

On the basis of many years of clinical investigation of schizophrenia at the Institute of Psychiatry USSR AMS, different syndromes of schizophrenia were isolated and described. Using them it is possible not only to identify any condition of the patients at the time of examination, but also to describe the stage of development of the disease. The practice of using a roster of syndromes to evaluate patients and make diagnoses by representatives of different psychiatric schools has shown that there is sufficient agreement with respect to syndromological (as opposed to diagnostic) evaluation.

EXPERIMENTAL MINERALOGY

[Article by Doctor of Geological and Mineralogical Sciences V. A. Zharikov, Moscow, Vestnik Akademii Nauk SSSR, Russian, Vol. 47, No. 10, October 1971, pp 38-43]

One of the most important problems of geological science is learning the physicochemical regularities of the formation of minerals, rocks and ore deposits. The urgency of that task is determined not only by the state and direction of the development of the earth sciences but also by direct practical needs: understanding the physicochemical essence of natural processes is very important for the development of criteria in searches for ore deposits, especially those not cropping out. The obvious difficulty in solving the problems arising in that is intensified by the fact that the physicochemical transformations which lead to the formation of minerals, rocks and ore deposits under endogenic (deep) conditions are exceptionally complex. They take hundreds of thousands and millions of years and take place at high temperatures (at 1000 degrees or higher) and pressures (up to tens of thousands of atmospheres) under the conditions of the addition and withdrawal of hundred of thousands to tens of millions of tons of material. Such phenomena have no analogs in any sort of production or technological processes, on the experience of which classical physical chemistry and thermodynamics have grown to a considerable degree. Therefore the initial attempts of geologists to use the achievements of those branches of science, which appeared to be natural, were unproductive and even caused at one time an ideological crisis of the physicochemical direction in geology.

To solve the problem it proved necessary to determine the physicochemical characteristics of natural processes in the earth's crust and on that basis, using the apparatus of physical chemistry and thermodynamics, to develop general methods of investigation. Decisive successes in that area were achieved in the 1940s and 1950s by the Soviet scientist D. S. Korzhinskiy.

"Study of Low-Intensity Luminescence of Some Microorganisms"

Moscow, Biologicheskiye Nauki, No 7, 1971, pp 102-105

Abstract: Luminescence was studied in a wide variety of bacteria: those capable of growing through fermentation or respiration, obligate and facultative aerobes and anaerobes, containing and not containing cytochromes, e.g., *Clostridium butyricum*, *Pseudomonas aeruginosa*, *Ps. fluorescens*, *Bacillus subtilis*, and others. Spontaneous luminescence was observed only in *B. brevis* var. G. B. R, S, P⁺, and P⁻ forms, *B. subtilis*, *B. cereus*, *B. mycoides*, *B. mesentericus*, *B. megatherium*, and *E. coli*, i.e., aerobes that contain cytochromes and are ammonifiers. The intensity of luminescence is 110 imp/sec. The luminescence lies in the region of 420 to 520 nit with a peak at 480 nit. The culture fluid (centrifugate) is responsible for the phenomenon rather than the cells.

"Destruction of Lacquer and Paint Coatings by Bacteria and Actinomycetes"

Moscow, Prikladnaya Biokhimiya i Mikrobiologiya, Vol 7, No 2, Mar-Apr 71, pp 236-242

Abstract: From the soil of various regions of the USSR, the following strains of bacteria and Actinomycetes were isolated which were found to cause destruction of surface coatings: Bacillus sphaericus var. 2P, Bac. cohaerens var. 4P, Bac. subtilis var. 1B, Flavobacterium acetylicum var. 7P, Mycobacterium sp. var. 1P, Propionibacterium pentosaceum var. 4B, Micrococcus aurantiacus var. 14C, Micrococcus aurantiacus var. 16 C, Actinomyces globisporus var. 9B, Actinomyces globisporus var. 10C, Actinomyces sp. Var. 10B. The cultural, morphological, and biochemical characteristics of the eight bacterial strains were determined. The behavior of surface coatings based on epoxy resin, alkyd resin, teflon, pentaphthalic resin, PVC, and organosilicon resin with respect to the 11 microorganisms isolated was determined in tests in which a sample of the surface coating was kept for 1 yr in contact with 1/2

USSR

ZHARIKOVA, G. G., et al., Prikladnaya Biokhimiya i Mikrobiologiya, Vol 7, No 2, Mar-Apr 71, pp 236-242

a culture medium containing (in g/l.) CaCO_3 3, MgSO_4 0.5, KH_2PO_4 1, KCl 0.2, agar 20 (pH 7.0-7.5). The only source of C for the microorganism was the coating. The samples were examined every month. The behavior of alkyd resin, epoxy resin, and teflon coatings with respect to mixtures of some of the microorganisms was determined in similar tests. The results of the tests are tabulated. The bacteria and actinomucetes isolated can be used for determining whether or not a surface coating is resistant to the action of microorganisms.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. ADDITION OF BETA PHENYL BETA ALANINE IN AN AMOUNT OF 100-600 MG PER CENT TO SYNTHETIC MEDIA WITH GLUCOSE RESULTED IN COMPLETE INHIBITION OF GRAMICIDIN C BIOSYNTHESIS INDEPENDANT OF THE PRESENCE OR ABSENCE OF THE AMINO ACID IN THE SEED MEDIUM. THE CULTURE GROWTH AND SPORULATION WERE IN BOTH CASES THE SAME. ON CAZEIN YEAST MEDIA COMPLETE INHIBITION OF GRAMICIDIN BIOSYNTHESIS WAS NOT BOERVED. HOWEVER, THE EFFECT OF THE SEED MATERIAL ON INHIBITION OF GRAMICIDIN C BIOSYNTHESIS IN MEDIA CONTAINING BETA PHENYL BETA ALANINE WAS EVIDENT. CAZEIN YEAST MEDIA RE SUFFICIENTLY RICH IN AMINO ACIDS AND OTHER ORGANIC COMPOUNDS AND THE PRESENCE OF BETA PHENYL BETA ALANINE IN THEM DID NOT IMPAIRE COMPLETELY THE PROCESS OF GRAMICIDIN BIOSYNTHESIS. INHIBITION WAS OBSERVED ONLY AT HIGH CONCENTRATIONS OF THE AMINO ACID. IN SYNTHETIC MEDIA CONTAINING NO SIGNIFICANT AMOUNTS OR NUMBERS OF ORGANIC COMPOUNDS BETA PHENYL BETA ALANINE ACTIVELY PARTICIPATED IN CELL METABOLISM AND BLOCKED CERTAIN STAGES OF BIOSYNTHESIS OF GRAMICIDIN C POLYPEPTIDE. BIOSYNTHESIS OF GRAMICIDIN C ON SYNTHETIC MEDIA WITH AMINO ACIDS
AS THE ONLY SOURCE OF NITROGEN

~~G. G. Zharikova, S. I. Markelova~~

Moscow State University

The following amino acids as the only source of nitrogen were used in the medium: glycocol, alanin, serin, cystein, threonin, valin, leucin, norleucin, asparaginic acid, lysin, ornithin, β -phenyl- α -alanin, β -phenyl- β -alanin, triptophan and histidin. The effect of the amino acids on growth of 4 variants of *Bac. brevis* var. G. B., that is R, S, P⁺ and P⁻ and the antibiotic biosynthesis was investigated. It was found that cells of all the variants of *Bac. brevis* var. G. B. were capable of using amino acids as the only source of nitrogen, while the rate of their consumption was different. On synthetic media with amino acids (9 out of 15) the cells of variant R synthesized pramicidin C, whereas the cells of variant P⁺ synthesized gramicidin C only on media with glycocol, serin, norleucin, asparaginic acid, lysin, ornithin histidin. The cells of variant S grown on media with serin, valin and histidin produced only traces of the antibiotic and the cells of variant P⁻ produced no antibiotic. Specific peculiarities of each variant with respect to consumption of amino acids as the only source of nitrogen were shown.

"On the Representation of the Jost-Lehmann-Dyson Type

Moscow, Teoreticheskaya i Matematicheskaya Fizika (Theoretical and Mathematical Physics), Vol. 3, No 3, June 1970, pp 305-219.

Abstract: An integral representation is obtained for functions holomorphic in tubular domains over arbitrary acute cones C and $-C$ and in a neighborhood of real n -divided open set O and belonging to algebras $H(C)$ and $H(-C)$. The technique of the boundary values of the holomorphic functions of many complex variables differs considerably from the traditional methods used for obtaining the Jost-Lehman Dyson representation. Use is not made of the representation of the solution to the Cauchy problem for the wave equation. The representation obtained makes it possible to write a new Nakanishi type integral representation for the scattering amplitudes $T(s, t)$ within the framework of the theory of perturbations corresponding to plane converging Feynman diagrams. The authors thank O. I. Sav'yalova for consultation on perturbation theory. Orig. art. has 21 refs.

"Nonlinear Boundary Value Problems of the Theory of Flexible Plates and Shallow Shells"

Nelineynyye kravevyye zadachi teorii gibkikh plastin i pologikh obolochek.
Tr. Seminara po mat. fiz. In-t mat. AN USSR (cf. English above. Works of the Seminar on Mathematical Physics. Institute of Mathematics of the Academy of Sciences of the Ukrainian SSR), 1970, vyp. 4, 416 pp, ill. (from RZh-Mekhanika, No 10, Oct 71, Abstract No 10V68)

Translation: Problem formulation is discussed as well as questions of the existence and uniqueness and methods of constructing approximate solutions of nonlinear boundary value problems of the theory of flexible plates and shallow shells.

The first chapter outlines known premises and hypotheses, and presents the derivation of fundamental equations of the theory of flexible plates and shallow shells. Principal attention is given to the energy derivation of the fundamental equations.

The second chapter deals with the reduction of linear and nonlinear

1/4

USSR

BEREZOVSKIY, A. A., ZHARIY, Yu. I., Nelineynyye krayevyye zadachi teorii gibkikh plastin i dologikh obolochek. Tr. Seminara po mat. fiz. In-t mat. AN USSR, 1970, vyp. 4, 416 pp, ill.

problems of the theory of shells to integral equations. Problems of constructing the Green's tensor in a given situation are discussed in detail, as well as questions of the integral representation of an arbitrary vector function and vector potentials. The construction of classical and generalized solutions of the given problem is considered for the case where the right-hand members of the boundary value problems are discontinuous or are generalized vector functions.

The third chapter is devoted to reducing axisymmetric problems of the theory of flexible shallow shells of revolution to integral equations. In particular, an equivalent system of nonlinear integral equations of flexible spherical shells is constructed, and the solvability of this system is discussed.

The next chapter discusses some approximate methods of constructing solutions of nonlinear boundary value problems of the theory of flexible plates and shells. Energy methods are considered as well as methods of approximating the kernels of nonlinear integral equations by degenerate

2/4

USSR

BEREZOVSKIY, A. A., ZHARIY, Yu. I., Nelineynyye krayevyye zadachi teorii gibkikh plastin i pologikh obolochek. Tr. Seminara po mat. fiz. In-t mat. AN USSR, 1970, vyp. 4, 416 pp, ill.

kernels. The method of perturbations and the method of successive approximations are discussed briefly. In addition, application of the Riesz-Fisher equations to solution of nonlinear problems of the theory of shells is considered.

The fifth chapter deals with problems of finding approximate solutions for specific cases of bending and stability of thin plates and shallow shells; specifically, large bends of shallow shells are considered where the planform is rectangular and the shell is loaded by moments distributed around the edge, as well as the problem of compression and bending of a shallow cylindrical panel, snapping of shallow spherical and conical shells under the effect of uniform external pressure and concentrated annular loads for various types of fastening, large bends of circular and elliptical plates, and other problems. These problems are solved by the method of approximating the kernels of nonlinear integral equations by degenerate kernels, the solution being limited as a rule to the first approximation.

3/4

USSR

BEREZOVSKIY, A. A., ZHARIY, Yu. I., Nelineynyye krayevyye zadachi teorii gibkikh plastin i pologikh obolochek. Tr. Seminara po mat. fiz. In-t mat. AN USSR, 1970, vyp. 4, 416 pp, ill.

In order to evaluate the accuracy of the resultant solutions, some of the problems are solved in addition by the method of perturbations and by the method of successive approximations.

The sixth chapter analyzes the oscillation and dynamic stability of shallow shells of revolution. The behavior of a closed spherical shell is considered for the case where it is subjected to the action of periodically changing normal external pressure, and also the problem of vibration shaking of a spherical shell whose supporting edge moves according to a periodic law.

The last two chapters (the seventh and eighth) discuss problems of the existence and uniqueness of generalized solutions of geometrically nonlinear problems of statics of the theory of plates and shallow shells of revolution, as well as problems of physically nonlinear shallow shells of revolution. Bibliography of 142 titles. V. I. Mamay.

"The Effect of Protracted Rocking on the Electrocardiogram of Animals"

Moscow, Voprosy Mediko-Biologicheskikh Issledovaniy. Materialy Konferentsii Molodykh Nauchnykh Rabotnikov Mediko-Biologicheskogo Fakul-teta (Aspects of Biomedical Research. Materials of a Conference of Young Scientific Workers of the Biomedical Faculty), Ministerstvo Zdravookhraneniya SSSR, 1970, 93 pp, pp 81-83

Abstract: Rabbits were used in experiments conducted to determine the effect of small statokinetic stimuli on the cardiovascular system, the electrocardiogram in particular. The sensation of rocking was achieved with the use of a special elevator-type device, which imparted a sense of alternating acceleration of about 0.5 g in a vertical direction. Lamellar electrodes were used for electrocardiography. The animals were left in a free and normal position. Prior to the beginning of the experiment, electrocardiograms were obtained from the animals. Subsequent

ZHARKAYA, A. S., Voprosy Mediko-Biologicheskikh Issledovaniy. Materialy Konferentsii Molodykh Nauchnykh Rabotnikov Mediko-Biologicheskogo Fakul-teta, 1970, pp 81-83

recordings were obtained 10 minutes after application of the electrodes, five minutes after the beginning of the experiment, and then every 10 minutes during the experiment; also 5, 10, and 20 minutes after the experiment was halted. An analysis of EKG showed the development of tachycardia within 5 minutes of the beginning of rocking, and a diminution of all EKG spikes, particularly the R and P spikes. It was found also that the electrical axis of the heart shifted to the left within 20 minutes of the beginning of the experiment, but reverted to its normal position within 5 minutes after cessation of the experiment. The data obtained were analogous to those obtained in experiments in which animals were subjected to centripetal acceleration in a centrifuge. Similar shifts in the EKG were established also with the use of the vector method of analysis.

"Epidemiology of Brucellosis in Foci of Mixed Type"

Alma-Ata, Zdravookhraneniye Kazakhstana, No 11, 1971, pp 19-21

Abstract: In various regions of Alma-Ata oblast, where livestock farming is the chief occupation, in spite of mixed foci, the epidemic process of brucellosis is different. In regions where most livestock is privately owned, there is a higher incidence of the disease (77% of cases occur in individual owners) than in collective livestock farms, which is attributed to better veterinary care. A greater number of persons who contract brucellosis seem to be infected through contact with cattle than through food. In a region where the terrain does not permit extensive pastureslands, and both large and small livestock come into contact, the predominant strain is Br. melitensis, with a lower incidence of Br. abortus in humans. In regions where cattle do not mix with sheep and goats, however, cultures isolated from cattle produce only Br. Abortus. In regions where brucellosis is endemic, bacteriological studies should be conducted on humans as well as livestock; cultures should be differentiated; and cattle, as well as smaller livestock, should be considered carriers.

"Indirect Fluorescent Antibody Method in Brucellosis"

Alma-Ata, Zdravookhraneniye Kazakhstana, No 8, 1971, p 40

Abstract: A comparative study of the indirect fluorescent antibody method showed that it is superior in diagnostic value to the Huddleson, Wright, and complement-fixation tests in mass epidemiological screening of the population in both foci of acute brucellosis and epidemic regions. Of 242 sera investigated, the indirect fluorescent antibody method was positive in 36% of cores compared with 30, 17, and 5% in the Huddleson, complement-fixation, and Wright tests, respectively. The large number of antibodies found by the immunofluorescence method in brucellosis patients is attributed to the presence in sera of incomplete antibodies (microglobulins).

Leningrad, Optiko-mekhanicheskaya Promyshlennost', No 9, Sep 70,
pp 30-34

Abstract: The authors describe the circuits and give the principal characteristics of a ruby monopulse laser in which the Q of the resonator is modulated by use of the linear electrooptic effect in potassium dihydrophosphate crystals. The OGM-20 is the first industrial model of a monopulse laser designed for jobs requiring brief high-power light pulses. The unit can be used to study the interaction between radiation and matter both in microvolumes with the use of special focusing lenses, and on the macroscopic scale in optically transparent media with the use of a telescopic system. An IFP-800 xenon tube is used for pumping. The instrument emits on a wavelength of 649.3μ with a prf of 1 Hz, pulse emission power is $2 \cdot 10^7$ watts, the duration of a

"Cutting of Heat-Resistant, High-Strength Titanium Alloys"

Obrabotka Rezaniyem Zharoprochnykh Vysokoprochnykh i Titanovykh Splavov [English Version Above], Moscow, Mashinostroyeniye Press, 1972, 198 pages.

Translation of Foreword: The Twenty-Fourth CPSU Congress defined the main trends in further development of the socialist economy and indicated the necessity of comprehensive acceleration of scientific and technical progress.

One primary trend in the development of the economy is increasing the effectiveness of production. This means that under today's conditions, ever greater significance is being given to increasing the output of products, improving their quality and technical and economic indicators.

Over the past years, the tool industry has solved important problems related to the creation of new tool designs, the development of the production and improvement of tools, as well as mass production of tools of ever stronger high-speed steels. Broad utilization of automated machine tools, continuous and automatic production lines in large-series and mass production requires an increase in the output of cutting tools of long life and

high accuracy, capable of operating under severe cutting conditions for long periods of time without replacement. Tool life can be increased if the tool industry is provided with high quality steels and alloys. Soviet scientists have created alloys with high strength characteristics and high heat resistance. The workability of alloys and steels can be improved by the use of various methods based on ultrasonics, electric contact and induction heating, application of small electric currents to the cutting zone, etc. These methods allow the life of a cutting tool to be increased by 2 to 5 times, increasing the cutting speed and productivity of processing. Part quality can be improved by using tools of natural and synthetic diamonds, as well as elbor.

The present work familiarizes the reader with research conducted into the physics of the cutting process, materials for cutting tools, optimal cutting modes and methods of improving the quality and workability of parts.

"A Wide-Band Instrument for Converting the Current of Semiconductor Nuclear Emission Detectors to a Pulse Train"

Moscow, Pribory i Tekhnika Eksperimenta, No 4, Jul/Aug 71, pp 101-103

Abstract: The authors describe a wide-band circuit for converting the current of semiconductor detectors of nuclear emission to a pulse train. The circuit is based on the equivalent of a four-layer diode. Stabilization of the bias on the control electrode made it possible to extend the dynamic range of data conversion by a factor of approximately 20, as well as to reduce the number of circuit elements and the required electrical energy. The device is simple, low in cost, has small overall dimensions and low weight (volume of no more than 100 cc, weight less than 50 g), and is highly shock resistant. The small number of elements ensures high circuit reliability, and enables accommodation in a hermetically sealed casing along with the power supply. The power for the entire converter can be supplied by low-voltage batteries (12-16 V). A distinguishing feature of the device is that the electrical energy requirement is proportional to the emission dose rate. In the absence

of radiation, the circuit takes practically no electrical energy. At a dose rate of 10^4 r/hr, the power consumption is 0.08 W, while the corresponding figure for 1 r/hr is 0.005 W -- 1.5-2 orders of magnitude less than the most economic conventional pickups. The prf is a nearly linear function of dose rate in the range from 10 to 10^4 r/hr. The circuit has excellent operational stability. Drift of the frequency emitted by the circuit when the detector was replaced by an equivalent resistor at constant temperature was no more than +0.02% in five days of operation.

"Optimal Irradiation Modes in Isotope Production"

Moscow, Atomnaya energiya, Vol. 29, No. 4, Oct 70, pp 260-264

Abstract: In response to the need for developing economically favorable modes for obtaining radioisotope energy through irradiation, the authors use as the criterion for such modes minimum expense for obtaining the required isotope and the maximum value of energy output. In this process, a fairly stable initial isotope is bombarded by neutrons to form an intermediate isotope, which quickly decays to form the energy-producing result. The authors write an equation for the expense incurred in obtaining one gram-atom of the fuel isotope, and three equations for the irradiation expense which apply in most practically important cases. They also find an equation for determining the required irradiation duration. Curves are plotted for the optimal output of the original and fuel isotopes under neutron irradiation, and a table of various isotopes and corresponding parameters for optimal irradiation modes is reproduced.

"Results of a Study of Anti-Wild-Oat Herbicides"

V sb. Khim. sredstva zashchity rast. (Chemical Plant Protectants -- collection of works), vyp 1, Moscow 1970, pp 241-247 (from RZh-Khimiya, No 13, 10 Jul 72, Abstract No 13N530 by T. A. Balyayeva)

Translation: The article describes results of tests of karbin (I), avadex (II), triallate (III), and yalan (IV) an anti-wild-oat herbicides. III and IV in a dose of 1-1.5 kg/ha and 4-6 kg/ha respectively eradicate wild oats and have a favorable effect on wheat and barley yields. III and IV must be incorporated into the soil with a cultivator to a depth of at least 7 cm. I and II eradicate wild oats, but have an adverse effect on wheat and barley. The activity of I declines in drought years.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. IN EARLIER STUDIES THE AUTHORS (FIZIKA ZEMLI, NO 2, 1967; DAN, 177, NO 1, 1967) EXAMINED THE ATTENUATION OF TORSIONAL AND RADIAL OSCILLATIONS IN THE EARTH. IN THE CASE OF TORSIONAL OSCILLATIONS A COMPARISON BETWEEN EXPERIMENTAL DATA AND THEORY MADE POSSIBLE A ROUGH DETERMINATION OF THE DISTRIBUTION OF THE DISSIPATIVE FUNCTION Q IN THE EARTH'S MANTLE. BY USING THE DETERMINED Q DISTRIBUTION AND FORMULATING A THEORY OF PERTURBATIONS FOR RADIAL OSCILLATIONS OF THE EARTH IT WAS POSSIBLE TO EXPLAIN THE ANOMALOUSLY HIGH Q VALUES FOR RADIAL OSCILLATIONS OBSERVED AFTER THE CHILEAN EARTHQUAKES. ALL DATA INDICATE THAT Q IN THE EARTH'S LIQUID CORE IS AT LEAST AN ORDER OF MAGNITUDE GREATER THAN Q FOR THE MANTLE. IN A LATER STUDY (DAN, 180, NO 2, 1968) THE AUTHORS FORMULATED A THEORY OF PERTURBATIONS FOR SPHEROIDAL OSCILLATIONS OF THE EARTH AND EXAMINED THE ATTENUATION OF SPHEROIDAL OSCILLATIONS WITHIN THE EARTH. THIS PAPER, A LOGICAL CONTINUATION OF THE EARLIER STUDIES, GIVES THE RESULTS OF COMPUTATIONS FOR THE FUNDAMENTAL TONE TO N EQUALS 27 AND THE FIRST FOUR OVERTONES WITH N EQUALS 1-7. THESE OSCILLATIONS ARE INTERESTING BECAUSE THEY ARE ESSENTIALLY DEPENDENT ON THE PROPERTIES OF THE EARTH'S CORE, WHEREAS OSCILLATIONS WITH LARGE N ARE ALREADY EXPELLED FROM THE CORE INTO THE EARTH'S MANTLE. THE GUTENBERG BULLEN MODEL A WAS USED IN THE COMPUTATIONS. IN THE MODEL THE CRUST AND MANTLE ARE BROKEN DOWN INTO 34 LAYERS WITH PIECEWISE CONSTANT PARAMETERS. THE EARTH'S CORE IS ASSUMED TO BE LIQUID.

ABSTRACT/EXTRACT--THE 34 LAYERS OF THE CRUST AND MANTLE WERE COMBINED INTO FOUR LAYERS: A) UP TO 36 KM; B) 38-300 KM; C) 300-1,000 KM; D) 1,000-2,900 KM (CRUST, SUBCRUSTAL ZONE, TRANSITION LAYER AND LOWER MANTLE RESPECTIVELY). THE RESULTS OF COMPUTATIONS FOR SPHEROIDAL OSCILLATIONS X_Q SUBSN ARE TABULATED. THE MOST IMPORTANT RESULTS OF THE COMPUTATIONS IN THIS PAPER IS THE LARGE Q VALUES WHICH WERE OBTAINED FOR SPHEROIDAL OSCILLATIONS WITH SMALL N . THE RESULTS GIVEN IN THE PAPER WILL GUIDE EXPERIMENTERS AS TO THE X_Q SUBSN VALUES WHICH SHOULD BE EXPECTED FROM OBSERVATIONS.
